- **Oxinazh electric Cisa designed Rim lock**

After the Italian Cisa designed electrical latch systems were widely approved and demanded by many people in Iran, the Iranian manufacturers aimed at making this type of lock and they were actually able to make locks very similar to the Italian Cisa ones. Therefore, Oxinazh company could make and supply a product with acceptable quality and reasonable price, which made a huge success in less than a year. Oxinazh rim lock is very similar to the Cisa Elettrika electric rim lock based on the structure and its electrical circuit. Both sides of electrical lock are made of brass. You can easily open it using a key from the outer part of the lock and in order to open it from the inner side you have to use a red push button. Moreover, for a better night security, the red push button can be locked from the inside by rotating its key 360 degrees. In addition, this kind of lock is different from the older versions of locks and it closes tightly like a hook when the electric lock latches and it doesn't open easily. Some of the users lock it in a wrong way and they damage the inner parts of the lock.

- **Materials used for Locks and Lock Tabs**

The body part of Oxinazh Cisa designed rim lock is made of strong galvanized sheet and is covered with electrostatic paint. The special shape of the cover of the lock fully restricts any access to the inside of it. It is actually in a way that when the cover of the lock is closed, it covers all parts of the lock even the lock tab and this makes the Oxinazh locks highly secure.

- **Oxinazh Rim Lock Installation**

Oxinazh Cisa designed rim lock can be installed on all types of pedestrian doors and inward doors in all dimensions and weights, as well as wooden doors. This type of lock can be installed horizontally on pedestrian doors and vertically on parking doors using hydraulic jacks which is known as a parking lock. Moreover, because of not needing a red push button and an external cylinder, it is affordable and its price is very reasonable. Considering the fact that the spring inside the tab of these locks is very strong, therefore, to ensure the complete, slow, and secure closing of the pedestrian's door, it is suggested to use a hydraulic door closer along with the installation of the lock.

- **Oxinazh Cisa designed Rim Lock Guaranty**

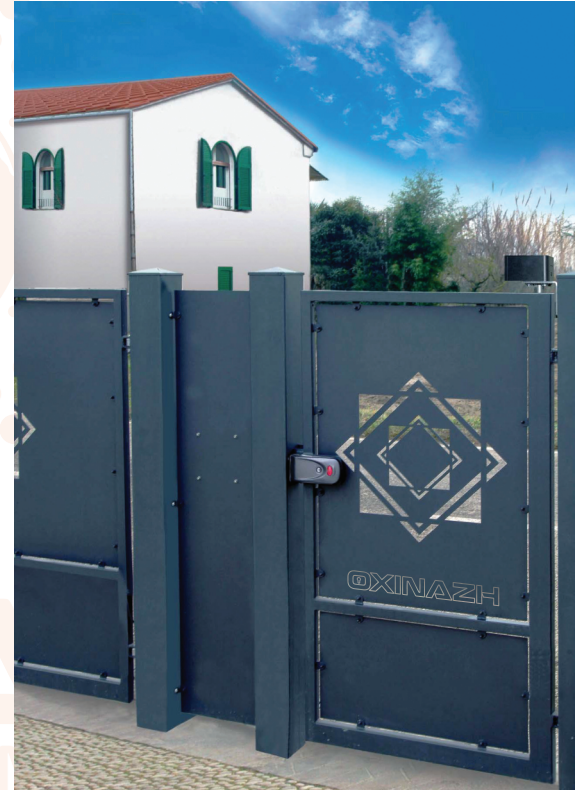

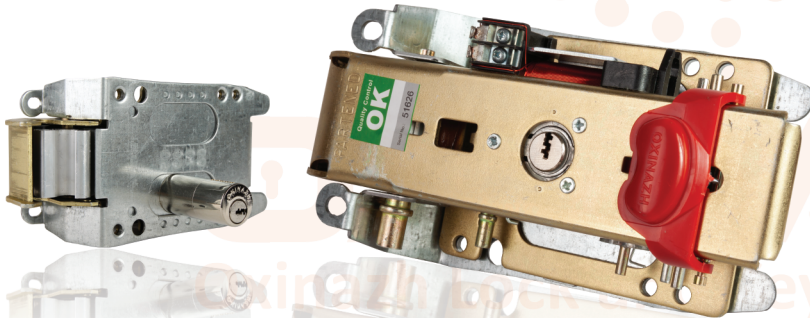

Oxinazh Cisa designed rim lock is distributed with normal and DND (Do Not Duplicate) brass keys and is guaranteed for 30 months. If this product is installed by the company's installer or an expert installer, it will work perfectly for many years. And the dear consumers can use the after-sales services of our company easily and safely during the warranty period, in case of any possible defects and problems.
